

Quad Static Shift Register

FEATURES

- COPLAMOS® N Channel Silicon Gate Technology
- Variable Length—Single Mask Programmable—1 to 134 bits
- Directly TTL-compatible on all inputs, outputs, and clock
- Clear function
- Operation guaranteed from DC to 1.0 MHz
- Recirculate logic on-chip
- Single +5.0V power supply
- Low clock input capacitance
- 16 pin ceramic DIP Package
- Pin for Pin replacement for AMI S2182, 83, 85

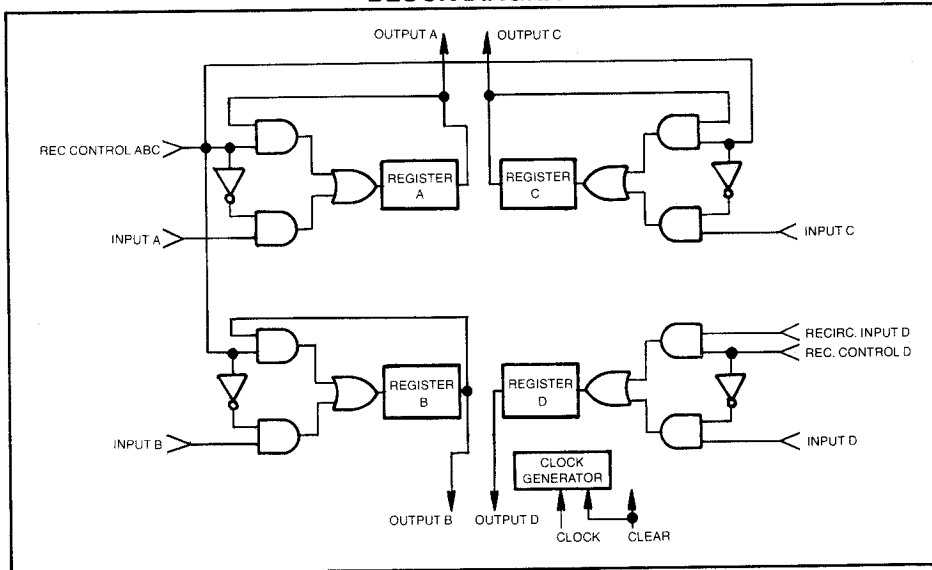

PIN CONFIGURATION

APPLICATIONS

- Memory Buffering
- Unique Buffering Lengths
- Terminals

BLOCK DIAGRAM

General Description

The SMC SR 5015-XXX is a quad static shift register family fabricated using SMC's COPLAMOS® N channel silicon gate process which provides a higher functional density and speed on a monolithic chip than conventional MOS technology. The COPLAMOS® process provides high speed operation, low power dissipation, low clock input capacitance, and single +5 volt power supply operation.

These shift registers can be driven by either T²L circuits or by MOS circuits and provide driving capability to MOS or T²L circuits. This device consists of four separate static shift registers with independent input and output terminals and logic for loading, recirculating or shifting information. The SR 5015-80, SR 5015-81, and SR 5015-133 are respectively 80, 81, and 133 bit quad shift registers.

The recirculate control pin is common for registers A, B, and C. Register D has an independent recirculate control pin as well as a recirculate input pin.

A clear pin has been provided that will cause the shift register to be cleared when the pin is at V_{cc}. A single T²L clock is required for operation.

The transfer of data into the register is accomplished on the low-to-high transition of the clock with the recirculate control low. For long term data storage the clock may be stopped and held in either logic state. Recirculate occurs when the recirculate control is high. Output data appears on the low-to-high transition of the clock pulse.

Bits 81 and 133 are available for flag storage.

This device has been designed to be used in high speed buffer storage systems and small recirculating memories.

Special custom configurations are achieved via single mask programming in lengths of 1 to 134 bits.

MAXIMUM GUARANTEED RATINGS*

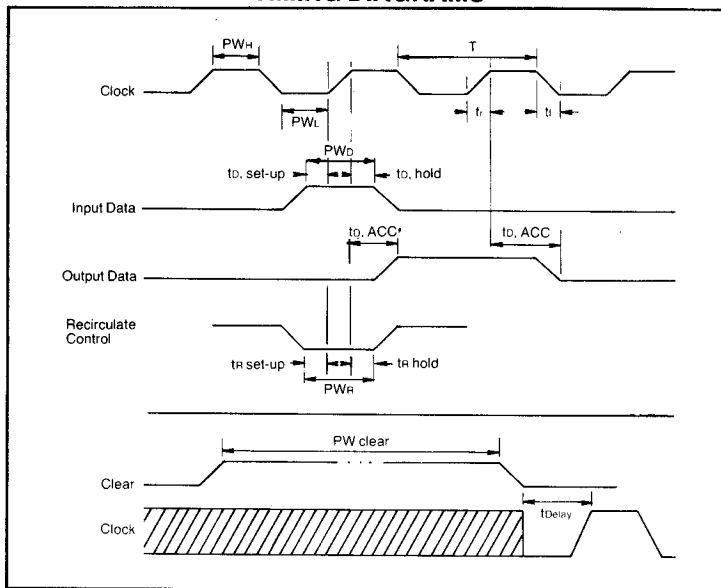

Operating Temperature Range	0°C to + 70°C
Storage Temperature Range	-55°C to + 150°C
Lead Temperature (soldering, 10 sec.)	+325°C
Positive Voltage on any Pin, with respect to ground	+8.0V
Negative Voltage on any Pin, with respect to ground	-0.3V

*Stresses above those listed may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied.

TIMING DIAGRAMS

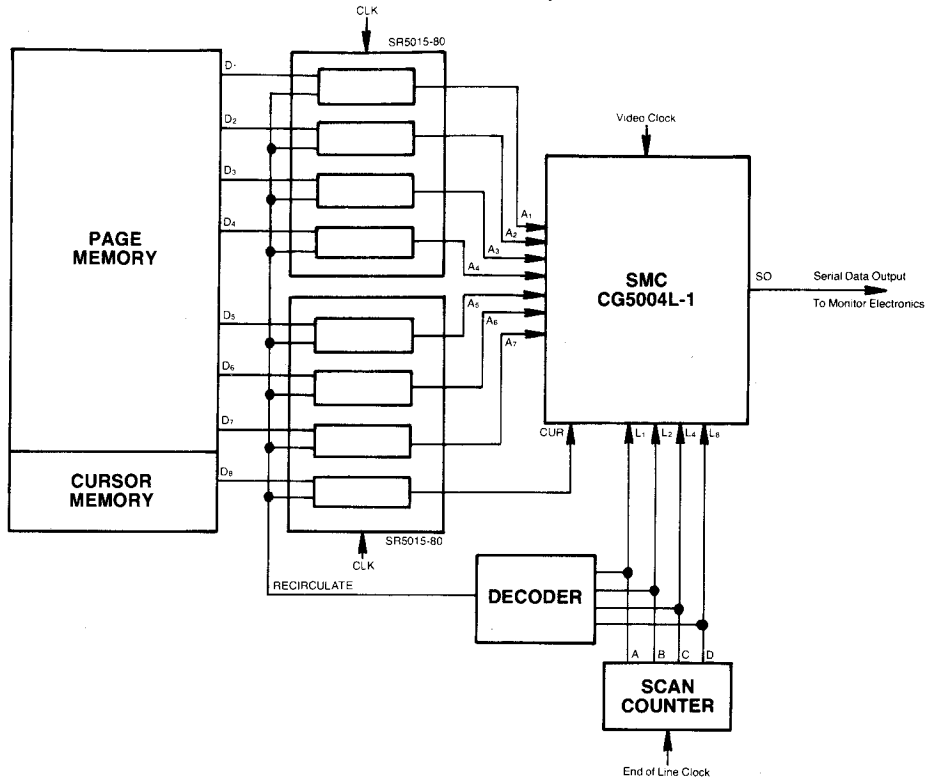

Description of Pin Functions

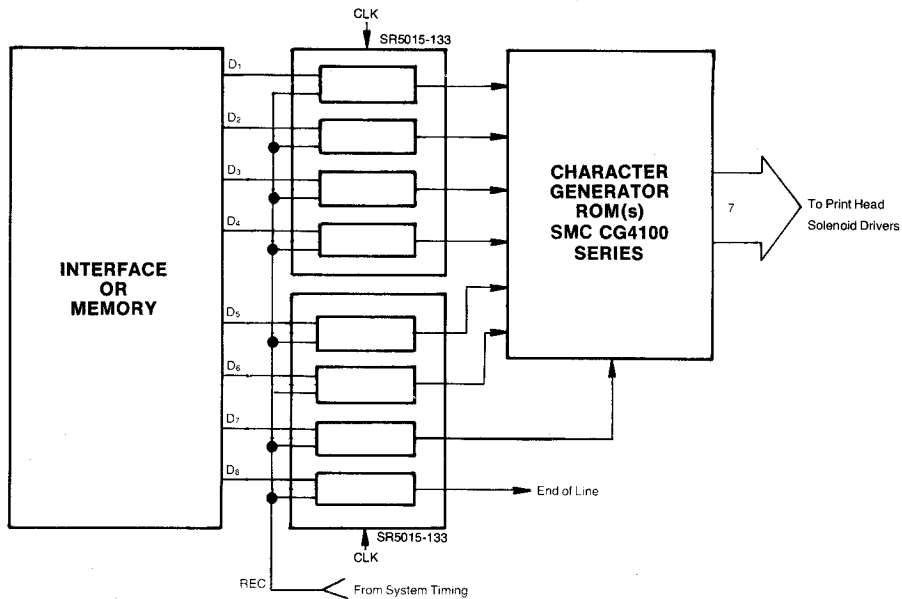

Pin No.	Symbol	Name	Function
1	A	Input A	Input signal which is either high or low depending on what word is to be loaded into shift register.
2	RECABC	Recirculate ABC	Input signal when high disconnects inputs from registers and connects outputs to inputs, thus recirculating data. Recirculates only A, B, C outputs.
3	CLR	Clear	Input signal when high forces outputs to a low state immediately and clears all the registers.
4	B	Input B	Input signal for B register.
5	Ob	Output B	Output signal for B register.
6	GND	GND	Power supply Ground.
7	Vcc	+5 Volt	5 volt power supply.
8	Oc	Output C	Output signal for C register.
9	CLK	Clock Input	Input signal which is normally low and pulses high to shift data into the registers. The data is clocked in on low to high edge of clock.
10	C	Input C	Input signal for C register.
11	NC	NC	
12	RECD	Recirculate Control D	Input signal which is normally low and, when goes high, disconnects Input D to register and connects Recirculate Input D to register.
13	D	Input D	Input signal for D register.
14	Ob	Output D	Output signal for D register.
15	RID	Recirculate Input D	Input signal which is the input to the D register when Recirculate Control D is high: RECD=1.
16	Oa	Output A	Output signal for A register.

APPLICATIONS

Line Buffer for CRT Display . . . 80 Characters per line.

Line Buffer for Matrix Printer . . . 132 Characters per line.

Quad Static Shift Right/Shift Left Shift Register

Last In First Out Buffer LIFO

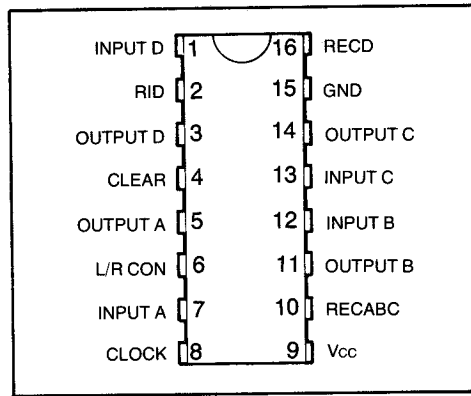

FEATURES

- COMPLAMOS® N-Channel Silicon Gate Technology.
- Quad 81 bit or Quad 133 bit
- Directly Compatible with T²L, MOS
- Operation Guaranteed from DC to 1.0MHz
- Recirculate logic on-chip
- Single +5.0V power supply
- Low clock input capacitance
- Single phase clock at T²L levels
- Clear function
- 16-pin Ceramic DIP Package

APPLICATIONS

- Bi-Directional Printer
- Computers—Push Down Stack—LIFO
- Buffer data storage—memory buffer
- Delay lines—delay line processing
- Digital filtering
- Telemetry Systems
- Terminals
- Peripheral Equipment

SECTION VIII

General Description

The SMC SR 5017 and SR 5018 are quad 133 (SR 5017) and quad 81 (SR 5018) bit static shift registers utilizing SMC's COPLAMOS® N channel silicon gate process. The COPLAMOS® process provides high speed operation, low power dissipation, low clock input capacitance, and requires only a single +5 volt power supply.

These shift registers can be driven by either T²L circuits or by MOS circuits and provide driving capability to MOS to T²L circuits.

This device consists of four separate static shift registers with independent input and output terminals and logic for loading, recirculating or shifting information right or left. This shift left/shift right (L/R Control) control input is common to all registers.

The recirculate control input is common for registers A, B, and C. Register D has an independent recirculate control input as well as a Recirculate Input.

A Clear input has been provided that will cause the shift register to be cleared when the input is at V_{cc}. A single T²L clock input is required for operation.

The transfer of data into the register is accomplished on the low-to-high transition of the clock with the recirculate control low. For long term data storage the clock may be stopped and held in either logic state. Recirculate occurs when the recirculate control is high. Output data appears on the low-to-high transition of the clock pulse.

Bits 81 or 133 are available for flag storage.

Timing Diagram

Description of Pin Functions

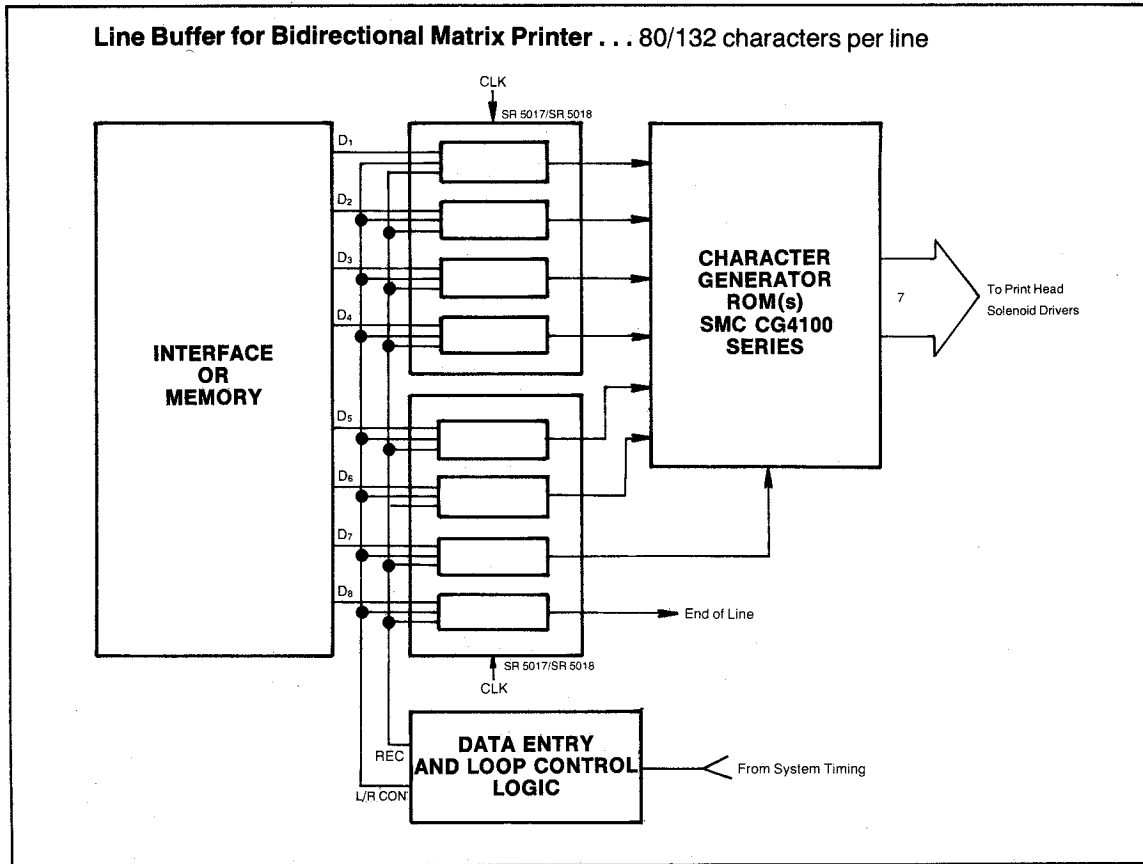

Symbol	Name	Pin	Function
D	Input D	1	Input signal for D register.
RID	Recirculate Input D	2	Input signal which is the input to the D register when recirculate control D is high: RECD = 1.
Od	Output D	3	Output signal for D register.
CLR	Clear	4	Input signal when high forces outputs to a low state immediately and clears all the registers.
Oa	Output A	5	Output signal for A register.
L/R CON	Shift Left/Shift Right Control	6	Input signal which is low for loading data and for shifting right. When L/R CON is high, the register will shift left.
A	Input A	7	Input signal which is either high or low depending on what word is to be loaded into shift register.
CLK	Clock Input	8	Input signal which is normally low and pulses high to shift data into the registers. The data is clocked in on low to high edge of clock.
Vcc	5 Volt	9	5 volt power supply.
RECABC	Recirculate ABC	10	Input signal when high disconnects inputs from registers and connects outputs to inputs, thus recirculating data. Recirculates only A, B, C outputs.
Oa	Output B	11	Output signal for B register.
B	Input B	12	Input signal for B register.
C	Input C	13	Input signal for C register.
Oc	Output C	14	Output signal for C register.
GND	GND	15	Ground.
RECD	Recirculate Control D	16	Input signal which is normally low and, when goes high, disconnects Input D to register and connects RECIRCULATE INPUT D to register.
